Solar - Geophysical Data

NO. 456 AUGUST 1982

Part I (Prompt Reports)

DATA FOR
JULY 1982
JUNE 1982

NATIONAL GEOPHYSICAL DATA CENTER

For obtaining bulletins on a data exchange basis, send request to: World Data Center A for Solar-Terrestrial Physics, NOAA/EDIS/NGSDC, D631, 325 Broadway, Boulder, Colorado 80303.

For sale through the National Geophysical and Solar-Terrestrial Data Center, NOAA/EDIS, D631, 325 Broadway, Boulder, Colorado 80303. Subscription Price: $64.00 annually for both part I (Prompt Reports) and part II (Comprehensive Reports) or $32.00 annually for either part. Annual supplement containing explanation is included. For foreign mailing add $42.00 for both parts or $21.00 for either part. Single issue price is $3.00 for either part and $2.50 for the extra issue. Make checks and money orders payable to: Department of Commerce, NOAA/NGSDC. Note: $4.00 handling charge per order.

To standardize referencing these reports in the open literature, the following format is recommended:
Solar-Geophysical Data, 450 Part I (or Part II), pages, February 1982, U.S. Department of Commerce (Boulder, Colorado, U.S.A. 80303).

SOLAR-GEOPHYSICAL DATA

No. 456

Issued in two parts

Helen E. Coffey, Editor

Joe H. Allen, Chief
Solar-Terrestrial Physics Division

CONTENTS

Part I (Prompt Reports)

Part II (Comprehensive Reports)

Notes:

"445A 54" listed under 1981 Jul means that the sunspot drawings for Jul 1981 were contained in Solar-Geophysical Data Number 444 - Part I, beginning on page 54.

A = Part I, B = Part II.

----- = no data available.
blank = data not yet received.

*An asterisk denotes either a value of the observed 12-month running mean or a predicted 12-month average that is based on preliminary observations of the Zurich and International relative sunspot numbers (R_Z and R_I). Parentheses enclose the 90% confidence limits. Shaded boxes enclose the most recent smoothed values; boxes not shaded enclose predicted values. Ra is the new symbol for R_A'. All tabulated entries of Ra are final values.

†R_I replaces R_Z as of January 1981.

For the current solar cycle, this table gives observed smoothed sunspot numbers up to the one calculated from the last measured value. These smoothed observed values are based on final monthly mean Zurich numbers through 1980, on final international numbers through March 1982, and on provisional monthly mean international numbers thereafter. Some table entries after the June 1976 number will change slightly when final data for 1982 are incorporated.

The entries with numbers in parentheses below them are predictions by the McNish-Lincoln method. (See page 10 in the February 1982 edition of the supplement to Solar-Geophysical Data.) By adding to and subtracting from each prediction the number in parentheses, one generates the 90% confidence interval--an interval centered on each prediction that has a 90% chance of containing the actual smoothed value.

The McNish-Lincoln prediction method generates meaningful estimates of smoothed sunspot numbers for no more than 12 months ahead. Beyond a year the predictions regress rapidly toward the mean of all 13 cycles of data used in the computation. Furthermore, the method is very sensitive to the date defined as the beginning of the current sunspot cycle, that is, to the date of the most recent sunspot minimum. In Solar-Geophysical Data, issues 390-401, we based the current cycle predictions on March 1976 as the end of cycle 20 and the onset of the new cycle 21. Later studies, including one published by M. Waldmeier, showed that June 1976 was more appropriately the minimum epoch. We therefore generated this table using the June 1976 date.

*MAXIMUM OF SUNSPOT CYCLE 21. The maximum smoothed sunspot number occurred in December 1979.

"REMARKS":

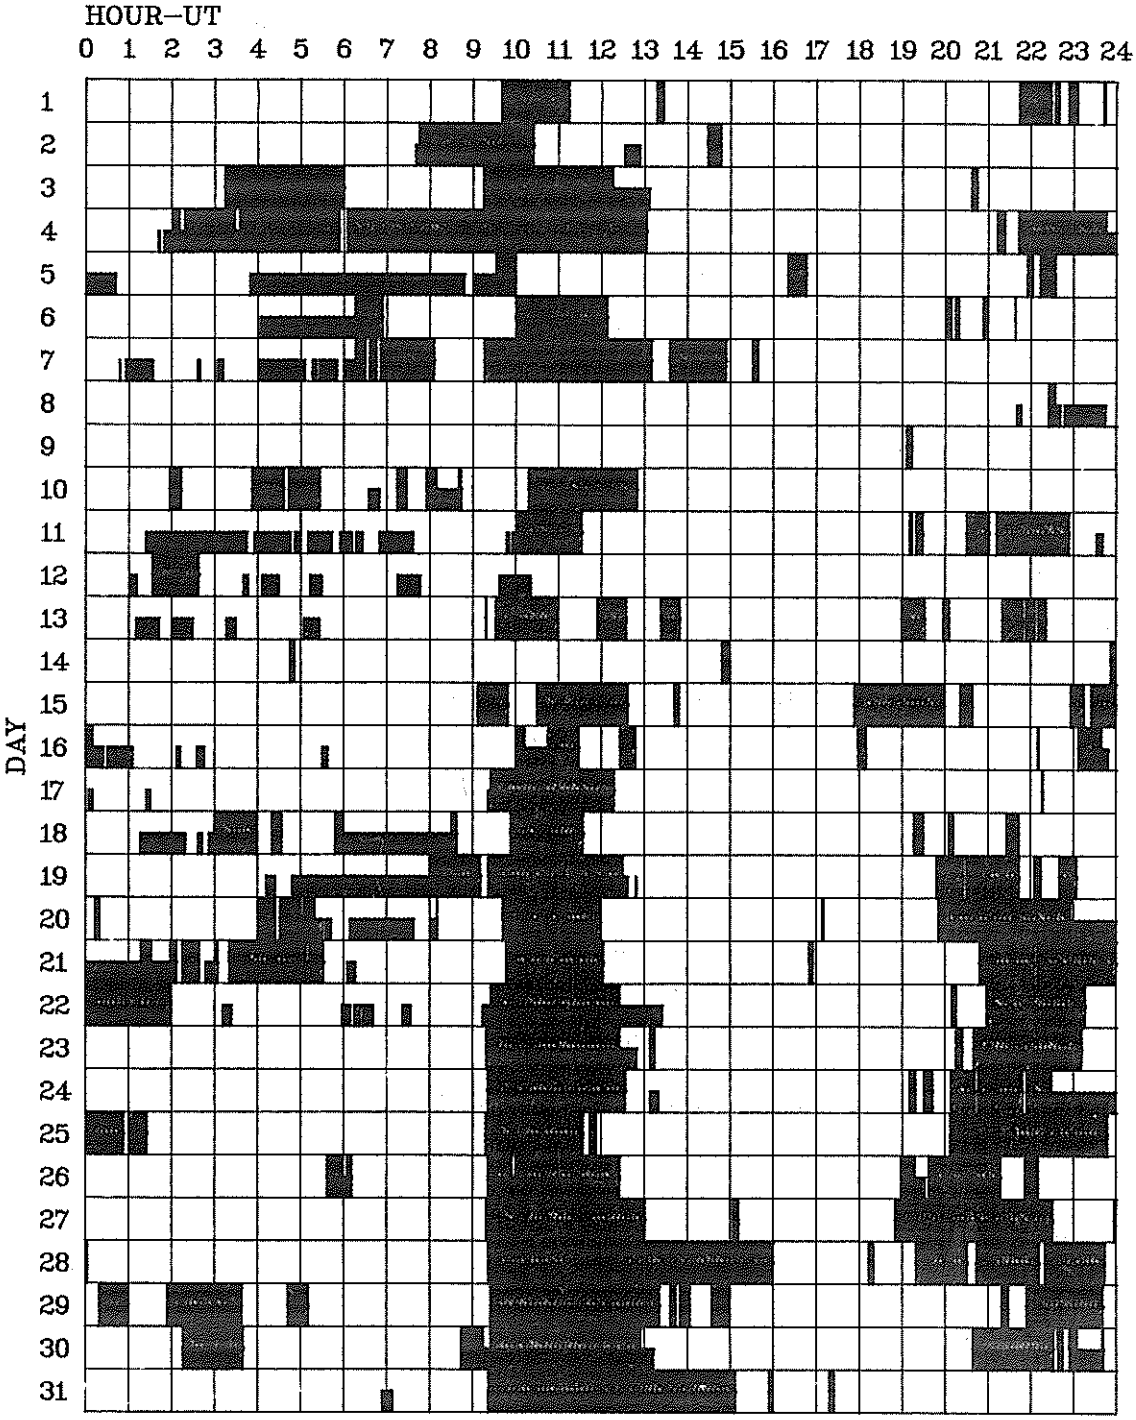
A = Eruptive prominence whose base is less than 90° from central meridian.
B = Probably the end of a more important flare.
C = Invisible 10 minutes before.
D = Brilliant point.
E = Two or more brilliant points.
F = Several eruptive centers.
G = No visible spots in the neighborhood.
H = Flare accompanied by high-speed dark filament.
I = Active region very extended.
J = Distinct variations of plage intensity before or after the flare.
K = Several intensity maxima.
L = Existing filaments show signs of sudden activity.
M = White-light flare.
N = Continuous spectrum shows effects of polarization.
O = Observations have been made in the H and K lines of CaII.
P = Flare shows helium D3 in emission.
Q = Flare shows Balmer continuum in emission.
R = Marked asymmetry in H-alpha line suggests ejection of high-velocity material.
S = Brightness follows disappearance of filament in same position.
T = Region active all day.
U = Two bright branches, parallel or converging.
V = Occurrence of an explosive phase: important, expansion within roughly 1 minute that often includes a significant intensity increase.
W = Great increase in area after time of maximum intensity.
X = Unusually wide H-alpha line.
Y = System of loop-type prominences.
Z = Major sunspot umbra covered by flare.

The 4-digit number appearing under "Remarks" denotes the calcium plage region number assigned by the Space Environment Services Center in Boulder, Colorado.

INTERVALS OF NO FLARE PATROL OBSERVATION

FOR PRECEDING SOLAR FLARE TABLE

JULY 1982



Observatories included in total patrol:

Bucharest	Istanbul	Manila	Peking	Ramey
Holloman	Learmonth	Palehua	Purple Mt.	Wendelstein
				Yunnan

Times of no flare patrol are shown by the shaded area for each day divided into times of no cinematographic patrol (bottom half of day) and times of neither visual nor cinematographic patrol (top half of day).

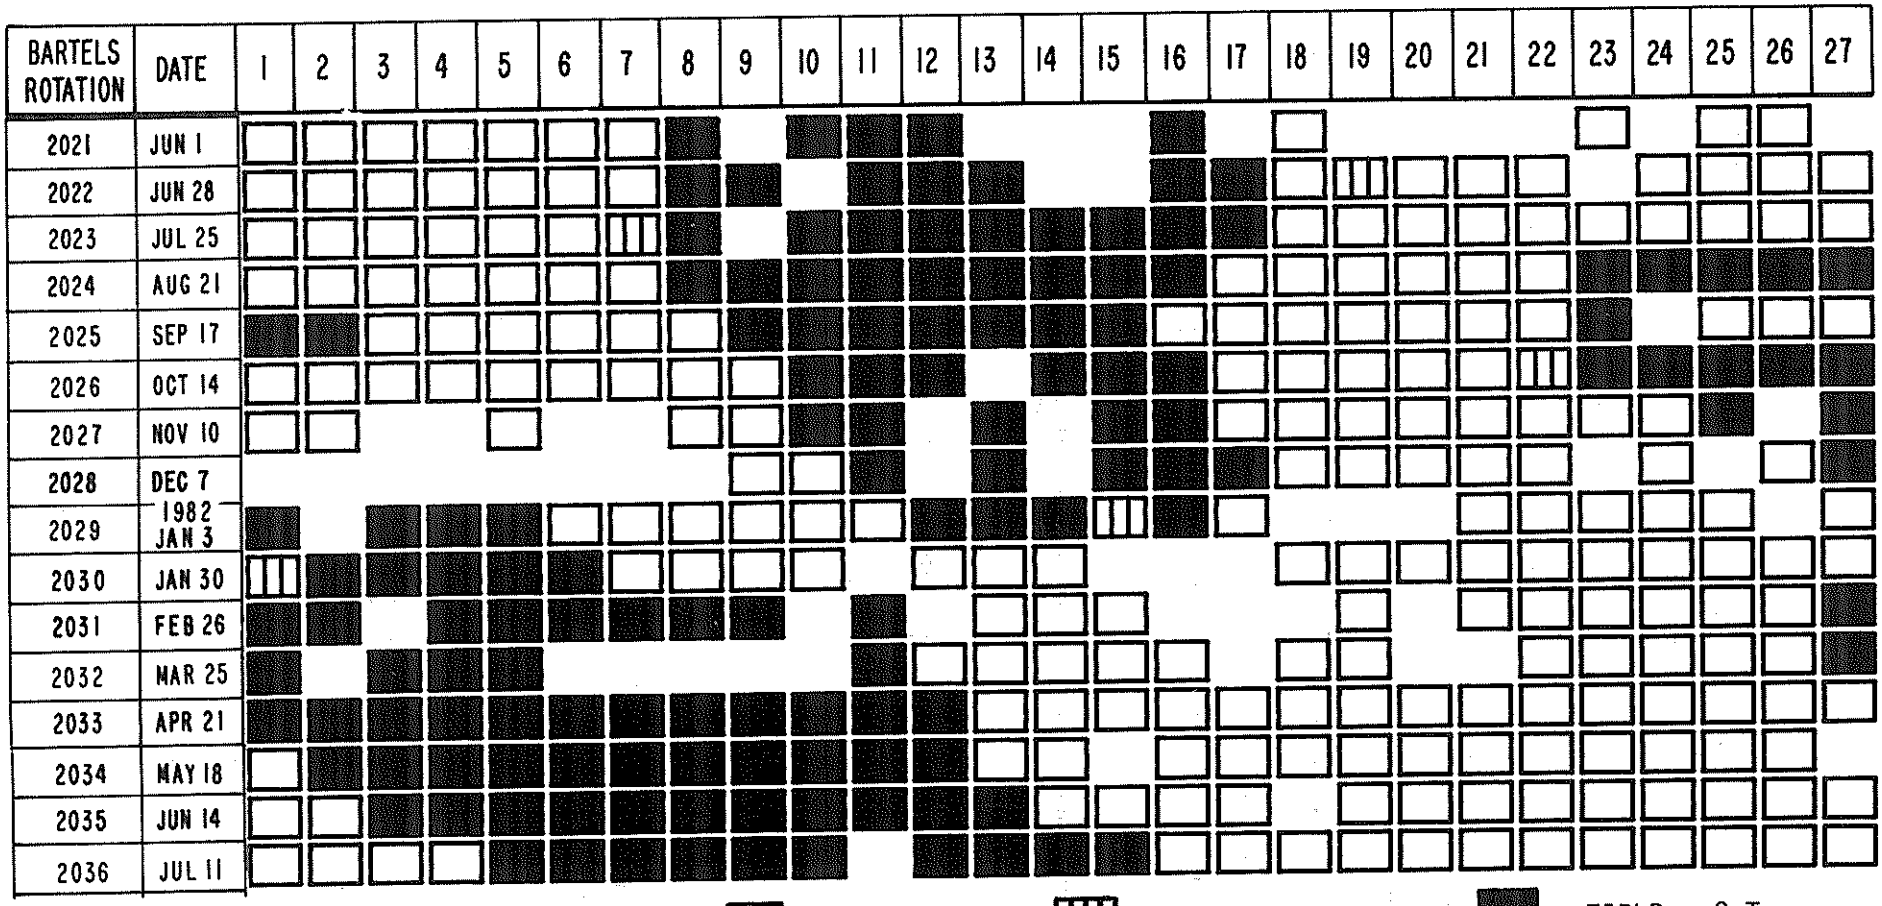
▒ = definitely towards the sun ▯ = definitely away from the sun

T = towards the sun A = away from the sun * = effect doubtful or not discernible - = missing data

The table shows daily inferences of the polarity of the interplanetary magnetic field. The first half of the day is based principally on magnetograms produced by the magnetometer at the Vostok Antarctic Station of the USSR. The magnetometer of the U.S. Air Weather Service now operated at Thule by the Danish Meteorological Institute is used for the second half of the day. The Thule magnetometer ceased operating in August 1981.

STANFORD MEAN SOLAR MAGNETIC FIELD



POLARITY OF THE MEAN SOLAR MAGNETIC FIELD: □ = FIELD >2μT, ▥ = -2μT ≤FIELD ≤2μT, ■ = FIELD <-2μT

No box visible indicates no data available for that day.

NOTE: Data are taken daily at 2000 UT. Dates given are not Bartels Rotation dates. These earlier dates correspond to the occurrence of phenomena on the Sun that affect the Earth during the given Bartels Rotation.

07/09			Field unsettled all day.
	1140		Weak vicinity College.
07/10			Field unsettled all day.
	1015		Localized SS vicinity College.
	1055		Localized SS vicinity College.
	1200	West	
07/11	0953	SSC	Field active through 2000 UT.
	1740	West	
07/12			Field unsettled to active.
	1305		Initial onset and strong SS at Lynn Lake. Several injections with recovery near 1615 UT.
07/13			Field active through 1600 UT.
	0120	East	
	0325	East	
	0955		Strong SS vicinity College.
	1617	SSC	Strong magstorm follows.
07/14			Magsstorm continues through 1800 UT with field active balance of day.
07/15			Field active all day.
	0120	East	
	0615	West	
	1420	West	
07/16			Field intermittently active.
	1840	West	Several injections with recovery near 1100 UT.
	1519	SSC	
07/17			Field intermittently active.
07/18			Field intermittently active.
	0810	West	
	1125	West	
	1350		Localized SS vicinity College.
	1620		Moderate SS, Norman Wells to Inuvik.
07/19	1220	West	
	1420	West	
	2125		
07/20			Field unsettled through 1300 UT.
	0625	≈ center	Sharp onset at Fort Simpson.
07/21			Field intermittently unsettled with no distinctive SS activity.
07/22	0805	West	
	1245		Slow onset, weak SS.
	1400	West	Slow expansion northward through Alaska.
07/23			Field intermittently unsettled.
	1120	West	Several minor injections with recovery near 1520 UT.
07/24			Field at magstorm level 0200-1930 UT.
07/25			Field active through 1200 UT, then unsettled balance of day.
	0330	East	
	0655	Center	Initial onset at Lynn Lake, several with recovery near 0800 UT.
07/26			Field unsettled all day.
	0845		Localized SS vicinity College.
	0900	West	
	1300		Localized SS vicinity College.
	1500	West	
07/27			Field unsettled all day.
	0450		Boulder still in partial ring current sector.
	1530		Weak SS.
07/28			Field unsettled all day.
	0615	Center	
	1110	West	
	1445		Weak SS
07/29			Field intermittently unsettled.
	0610	East	
	1120	West	
	1330	West	Several injections with recovery near 1630 UT.
07/30			Field unsettled after 0500 UT
	0620		Weak SS
	0810	West	
	1030		Weak SS localized vicinity College.
	1130		Weak SS
	1630	West	
07/31			Field intermittently active.

The symbols used under the column heading SPECTRAL TYPE have the following definitions:

B = Single burst
G = Small group (< 10) of bursts
GG = Large group (> 10) of burst
C = Underlying continuum (particularly with Type I)
S = Storm in the sense of intermittent but apparently connected activity
N = Intermittent activity in this period
U = U-shaped burst of Type III

RS = Reverse slope burst
DP = Drifting pairs
DC = Drifting Chains
H = Herringbone
W = Weak
P = Pulsations
CONT = Continuum
UNCLF = Unclassified activity
DCIM = Fast drift

For less than 24-hour coverage, parentheses enclose the number of hours for which data are available. For Climax and Huancayo, parentheses enclosed the number of section hours whenever the sum of both sections falls below 40 hours.

Quiet days (Q) and disturbed days (D), geomagnetic planetary three-hour-range indices (Kp) (integers alone are equivalent to those normally given with a small zero), magnetic character figures (Cp), and average amplitude (Ap) (unit 2 nT) prepared by Geophysikalisches Institut at the University of Göttingen, F.R. of Germany for the International Service of Geomagnetic Indices. Ten most quiet days [Q1-Q0[10]] and five most disturbed days [D1-D5] are ordered from most quiet or disturbed, respectively. A or K means "not really quiet" (A = "Ap>6", K = "Ap≤6 but one Kp≥30 or two Kp values≥3-"). An asterisk means "not really disturbed" (Ap<20).

Geomagnetic three-hourly indices Km, Kn, Ks, daily mean values, Am, An, As (unit 1nT), and indices aa are prepared by M. Menvielle of the Institut de Physique du Globe, Paris, France. For aa indices daily north (N) and south (S) values, and half-daily antipodal mean (M) values are given. Quiet 24-hour and 48-hour intervals centered on 1200 UT are indicated for really quiet as C and for quiet but with some slightly disturbed three-hour intervals as K. The first hundred years series of aa is in IAGA Bulletin No.33, and complementary data are in IAGA Bulletin No.39.

NOTE: aa-indices are provisional from 1 January 1981 until further notice, in connection with change of southern hemisphere observatory.

Solar flux adjusted to 1 A.U. (Sa) prepared by National Research Council, Ottawa. An asterisk denotes flux adjusted for burst. Observed solar flux (S) available from WDC-A for STP.

Provisional sunspot number (Ri) (dependent on observations at Locarno Observatory complemented by an international network) by A. Koeckelenbergh, Observatoire Royal de Belgique, Bruxelles, Belgium.

Sunspot numbers (Ra) are prepared by the American Association of Variable Star Observers.

Sunspot numbers (Rs) are computed from the daily Sa values by WDC-A for STP.

Inferred interplanetary magnetic field (IMF) prepared from Vostok observations for first half-day by the Institute for Terrestrial Magnetism, Ionosphere and Radio Propagation, Moscow, USSR; and prepared from Thule observations for second half-day by Space Environment Services Center, NOAA, Boulder, Colorado, USA. T = Toward the sun, A = Away from the sun, * = Effect doubtful or not discernible, - = Missing Data.

These data are reprinted from the monthly publication *Solar-Geophysical Data* issued by the National Geophysical and Solar-Terrestrial Data Center. *Solar-Geophysical Data* is available on a data exchange or subscription basis. For information write to address as given above.

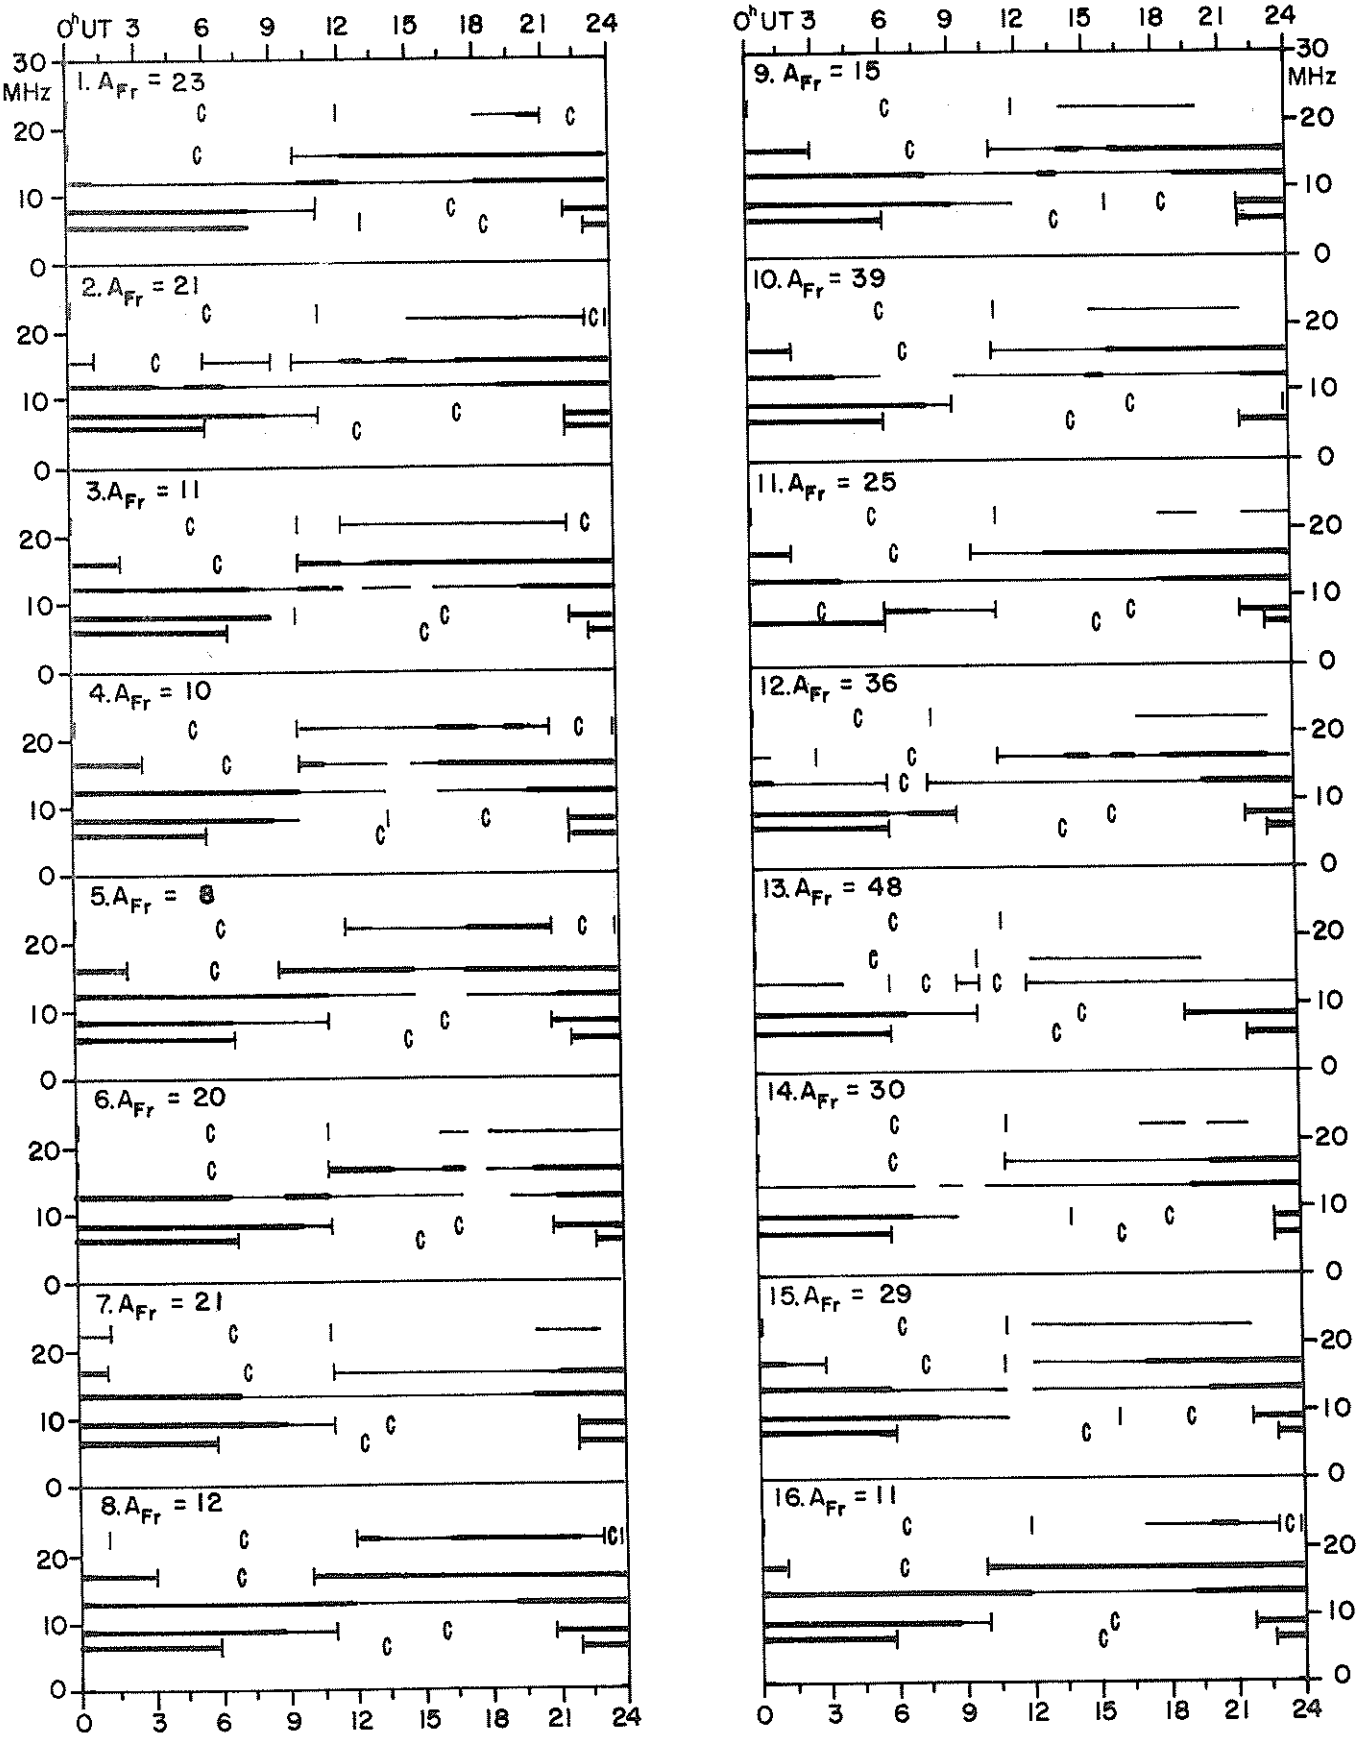
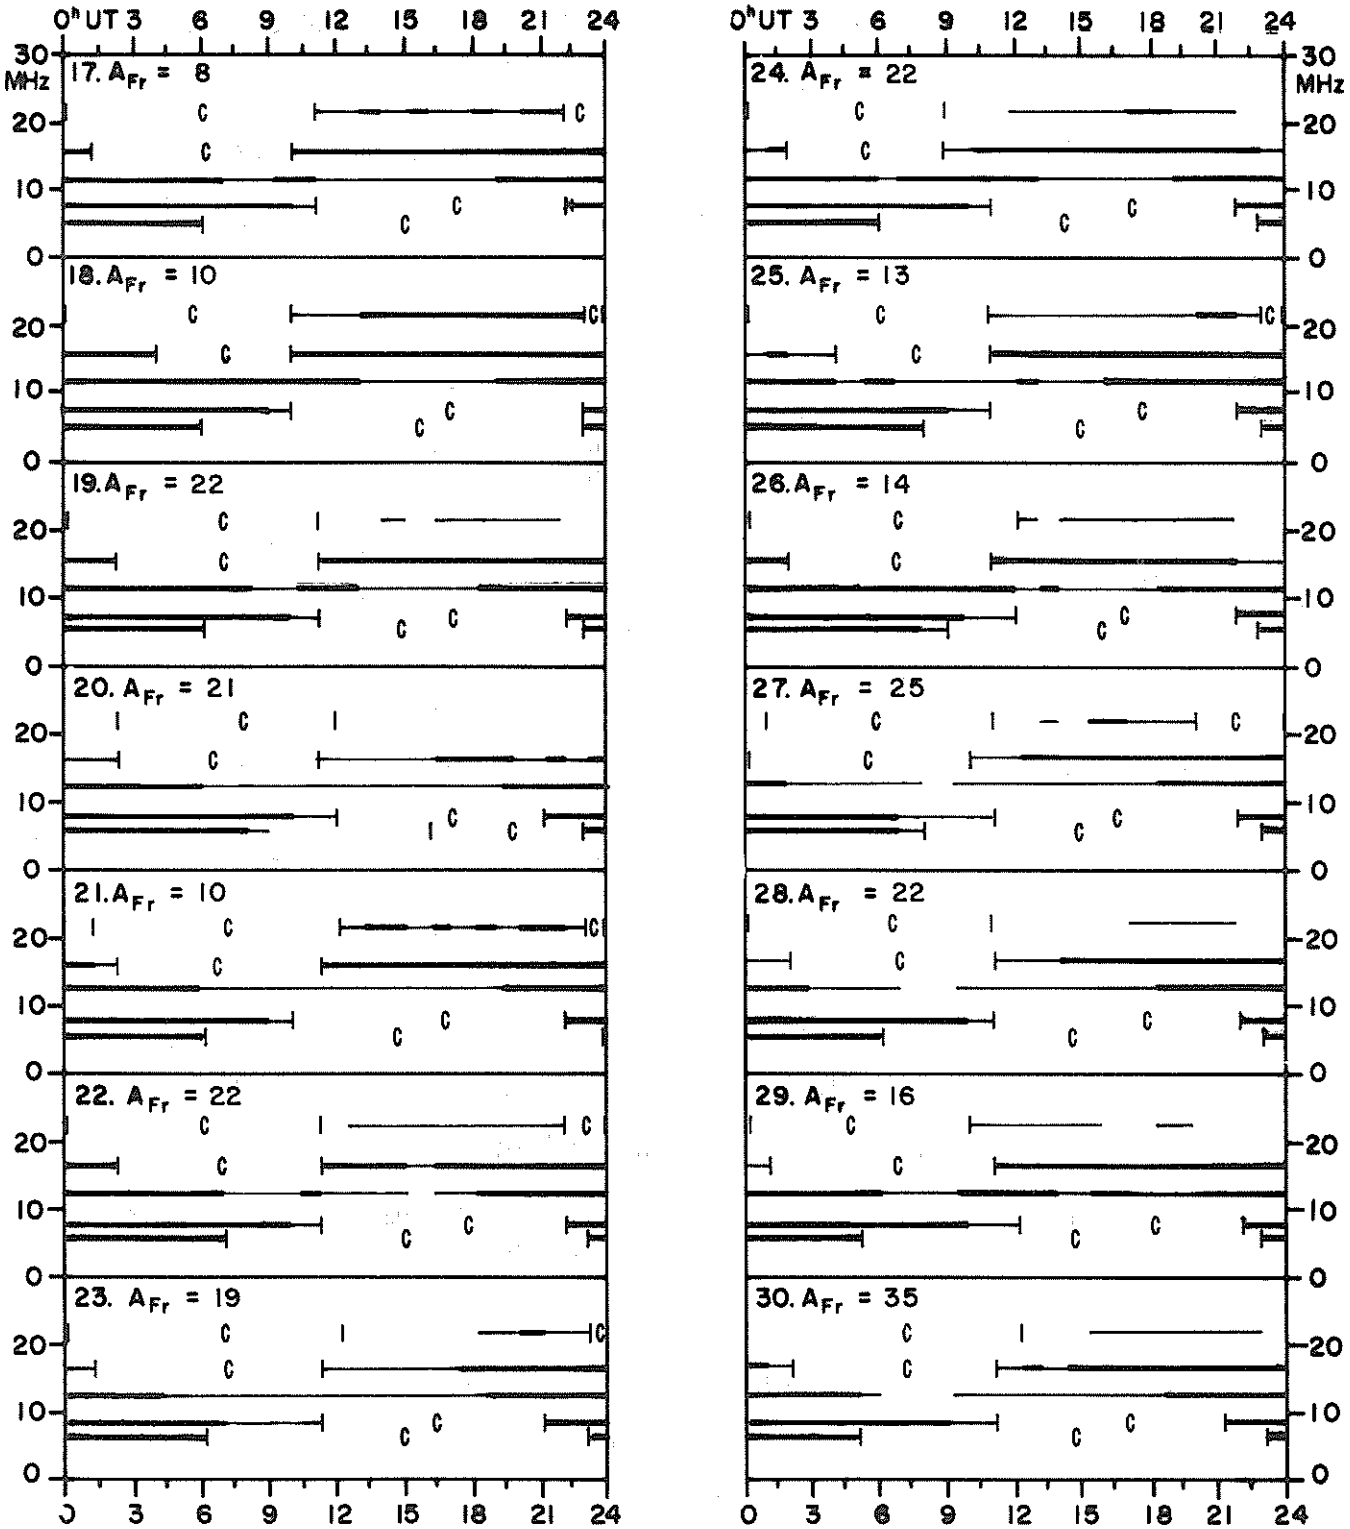
TRANSMISSION FREQUENCY RANGES -- NORTH ATLANTIC PATH

JUNE 1982



TRANSMISSION FREQUENCY RANGES -- NORTH ATLANTIC PATH

JUNE 1982



Field strengths from five frequencies, 6.4, 8.6, 13.0, 17.0 and 22.5 MHz, observed on a Norddeich -New York circuit are represented above. Heavy solid lines represent field strengths ≥ -12 dB above 1 μv/m (transmitter power reduced to 1 kW). Observed field strengths between -12 dB above 1 μv/m and -40 dB above 1 μv/m are represented by the fine line.

RADIO PROPAGATION QUALITY INDICES

MEAN	3.8	4.4	3.8	5.0	5.0

CALCULATION OF QUALITY INDICES (Q)

From all 24 hourly field strength values and from all frequencies of the same circuit a median field strength value is calculated (FD). This daily value is compared with the average value (FA) of the preceeding 27 days (1 sun rotation).

$$Q = 6.0 + 20 \log(FD/FA)/3.0$$

The quality indices vary from 0.0 to 9.9 where 6.0 is normal. Conditions are "normal" (index = 6.0), if they correspond to the average of the preceeding 27 days.

Scale for Quality Indices

0.0 - 1.0 = very poor
1.1 - 3.0 = poor
3.1 - 5.0 = fair
5.1 - 7.0 - normal
7.1 - 9.0 = good
9.1 - 9.9 = very good

WORLD DATA CENTER A
FOR
SOLAR-TERRESTRIAL PHYSICS

The ICSU Panel on WDCs has recommended that it would be appropriate courtesy to acknowledge in publications that data were obtained from the originating station or investigator through the intermediary of the WDCs. The following statement is suggested:

"Data used in this study were provided by WDC-A for Solar-Terrestrial Physics, NOAA E/GC2, 325 Broadway, Boulder Colorado 80303, USA."
