

Date: 13 April, 1965.

Observer: Parmenter

Times: around 19:00 u.t. (short observation)

Sky Condition: mostly clear, but somewhat "hazy", with wind-gusts.

Solar Limb: poor, to fair, by "spells"

Apparatus Used: 7" Image "Plotter" — 10" aperture Spectroheliograph (Ha)

Remarks: Observation taken while getting tower-telescope into operation (cleaning, oiling, etc). Windy conditions making atoms very "rough", and gusts finally causing closure.
